

APPENDIX

1. (Three Times Amended) An apparatus for managing call billing records for users of a signaling network operative to carry user calls, comprising:

a gateway interfacing the signaling network with an Internet Service Provider and a local exchange carrier and operative to collect call billing data from the signaling network in a first data structure format; and

a network processor operative to:

receive the collected call billing data in the first data structure format from the gateway,

convert the collected call billing data from the first data structure format to a second data structure format, and

transmit the call billing data in the second data structure format to a data network for billing processing by a co-carrier access billing system for settlement with the Internet Service Provider and the local exchange carrier.

2. (Not Amended) The apparatus of claim 1 wherein the gateway comprises a signaling gateway.

3. (Once Amended) The apparatus of claim 1 wherein the network processor comprises an interface that mates with a communication link coupled to the gateway.

4. (Once Amended) The apparatus of claim 1 wherein the network processor is further operative to poll the gateway to collect the collected call billing data in the first data structure format.

5. (Not Amended) The apparatus of claim 1 wherein the first data structure format comprises raw ASG call event records (CERs).

6. (Not Amended) The apparatus of claim 1 wherein the second data structure format comprises data in a Bellcore automatic message accounting (AMA) format.

7. (Once Amended) The apparatus of claim 1 wherein the data network is configured to periodically receive the call billing data in the second data structure format for billing processing.

8. (Not Amended) The apparatus of claim 7 wherein the data network comprises a local traffic system (LTS), and wherein the second data structure format comprises an industry standard automatic message accounting (AMA) format.

9. (Once Amended) The apparatus of claim 1 wherein the network processor comprises a network platform.

10. (Three Times Amended) A system for managing call billing records for users of a signaling network, comprising:

a signaling network having communications capabilities to carry user calls;

a signaling gateway interfacing the signaling network with an Internet Service Provider and a local exchange carrier and operative to collect call billing data resulting from the calls in a first data structure format;

a communication link coupled to the signaling gateway; and

a network processor communicating with the signaling gateway via the communication link and with a data network and operative to:

convert the collected call billing data from the first data structure format to a second data structure format conducive to conducting billing processing and
transmit the call billing data in the second data structure format to the data network for billing processing by a co-carrier access billing system for settlement with the Internet Service Provider and the local exchange carrier.

11. (Once Amended) The system of claim 10 wherein the data network is operative to periodically receive the call billing data in the second data structure format for billing processing.

12. (Once Amended) The system of claim 10 wherein the network processor is operative to poll the gateway to collect the collected call billing data in the first data structure format.

13. (Once Amended) The system of claim 12 wherein the network processor is operative to poll the gateway at preset intervals.

14. (Once Amended) The system of claim 10 wherein the data network is configured to receive the call billing data in the second data structure format for billing processing.

15. (Once Amended) The system of claim 14 wherein the data network comprises a local traffic system (LTS), and wherein the received call billing data in the second data structure format comprises an industry standard automatic message account (AMA) structure code 625 format that is used to implement billing processing.

16. (Not Amended) The apparatus of claim 10 wherein the network processor includes an interface coupled with the communication link operative to mate the network processor with the signaling gateway.

17. (Thrice Amended) A method of managing call billing records of users of a signaling network operative to carry user calls, comprising:

collecting call billing data with the first computer device in a first data structure format at a first computer device, said first computer device interfacing the signaling network with an Internet Service Provider and a local exchange carrier;

transferring the call billing data from the first computer device to a second computer device;

converting the call billing data at the second computer device from the first data structure format to a second data structure format; and

transmitting the call billing data in the second data structure format to a data network for billing processing by a co-carrier access billing system for settlement with the Internet Service Provider and the local exchange carrier.

18. (Once Amended) The method of claim 17 wherein the first computing device includes a signaling gateway.

19. (Once Amended) The method of claim 17 wherein the second computer device includes a network processor.

20. (Once Amended) The method of claim 17 wherein the step of transferring includes transferring the call billing data in accordance with a file transfer protocol.

21. The method of claim 17 wherein the step of transferring includes transferring the call billing data over a communication link provided between the first computer device and the second computer device.

22. (Three Times Amended) A method of managing call billing records generated from usage within a signaling network by users, comprising:

collecting call billing data with a signaling gateway in a first data structure format, said signaling gateway interfacing the signaling network with an Internet Service Provider and a local exchange carrier;

transferring the call billing data from the signaling gateway to a network processor;

converting the call billing data with the network processor from the first data structure format to a second data structure format conducive to processing billing information; and

transmitting the call billing data in the second data structure format to a data network for billing processing by a co-carrier access billing system for settlement with the Internet Service Provider and the local exchange carrier.

23. (Not Amended) The method of claim 22 further comprising routing call billing data for a user via the network processor to a data network.

24. (Not Amended) The method of claim 22 further comprising generating an invoice from the data network for delivery to individual users.

25. (Once Amended) The method of claim 22 wherein the step of transferring includes transferring the call billing data using a file transfer protocol.

26. (Once Amended) The method of claim 22 wherein the step of transferring includes transferring the call billing data via a communication link between the signaling gateway and the network processor.

27. (Not Amended) The method of claim 22 further comprising generating an alarm signal with the network processor.

28. (Not Amended) The apparatus of claim 1 wherein the local exchange carrier comprises an incumbent local exchange carrier.

29. (Not Amended) The system of claim 10 wherein the local exchange carrier comprises an incumbent local exchange carrier.

30. (Not Amended) The method of claim 17 wherein the local exchange carrier comprises an incumbent local exchange carrier.

31. (Not Amended) The method of claim 22 wherein the local exchange carrier comprises an incumbent local exchange carrier.
